While the song itself is fairly uncomplicated, the lyrics offer multiple linguistic challenges. At any given time, the lyrics could mean one of two things: that something is made by a person or that the action has a physical outcome in the world..1. Field of the Invention The invention relates to an ignition composition for igniting solid propellant and a method of using the same, more particularly to an ignition composition having a high ignition rate and a long duration of action for igniting solid propellant, and a method of using the same. 2. Description of the Related Art The conventional type of pyrotechnic primer which is currently applied in

ignition compositions of an igniter for a rocket propulsion system generally contains a powder and a red-hot wire, and is placed in the rocket to ignite the propellant before ignition of the propellant. The powder mixed in the pyrotechnic primer contains aluminum powder, potassium perchlorate and/or strontium perchlorate. As the powder is ignited, the aluminum powder reacts with oxygen in the air to generate heat to start the explosion of the propellant. The red-hot wire is used for igniting the aluminum powder in the powder. Accordingly, the ignition time of the pyrotechnic primer is determined by the time needed for the red-hot wire to react with the aluminum powder. The conventional pyrotechnic primer has the following drawbacks: 1. the powder is not burnable and is liable to form fine particles during the burning process, thereby contaminating the explosive; 2. after ignition, the red-hot wire will continue to burn due to the self-propagation characteristic of the combustion reaction, even after the propellant is burnt down to zero; 3. the ignition rate is limited to a maximum rate of about 8-10 times the initial ignition rate of the powder per minute, which cannot meet the requirement of a high ignition rate; and 4. the burning process of the powder is time-consuming, leading to a long duration of action of the ignition composition. Therefore, the conventional pyrotechnic primer is not suitable for igniting a fast-burning propellant with a short duration of action.

Further, for igniting a solid rocket propellant, ignition-promoting particles must be mixed in the propellant to promote the ignition of the propellant. In the conventional ignition composition, however, the ignition-promoting particles, such as potassium perchlorate, are disposed in
