She was not happy, and a part of. Get a free quote from a business you might be interested in. Why convert to JSON? MongoDB can store a vast array of data, but as soon as you start trying to start working with this data in non-relational databases you will need to have a system which either converts your data to and from normalised format to avoid this problem or convert your data to JSON because this is a very efficient format to store any dataset. Translatable app for ios, android, mac, blackberry, windows Why does all this matter? JSON stands for Javascript Object Notation, and is a lightweight way to store data in JavaScript (i.e., JavaScript and most languages run on a server and database). You can save information about users, products, tasks, and so on into JSON and store it in your database. JSON is a lightweight format and allows you to post data to any server that supports PHP and JavaScript. Whilst there are far more lightweight formats, JSON is a common and pretty popular one. In other words, you could use a PHP and JavaScript system to interact with a database, or directly interact with MongoDB.

Q: Incorrect date_from_sql query with BigQuery Standard SQL My table is created with a timestamp field that the following standard SQL query (in BigQuery) returns a SYNTAX error: `SELECT * FROM (SELECT user_id, CONCAT(YEAR(date_created),'/',MONTH(date_created),'/',DAY(date_created)) as date_created, SEC_TO_TIME(sum(time_spent)) as total_time_spent FROM `my_table` GROUP BY user_id) GROUP BY user_id` I noticed the error for the user_id that date_created corresponds to for the date_created field. I have tried the solution proposed in the docs: Date and time functions on `TIMESTAMP` and `DATETIME` However, I still have the problem.
