Stack overflow explains an example of a tail call And the part that gets me is the description of the stack frames. It says that the method should save enough data to be able to restore exactly at the point where it was tail-called. See the bold text in the following snippet. ((Method)[Method ()[Target.Snd]]. The method receives a short integer with the return address at the top, pops it off the stack, then returns and pops the top of the call stack off the stack. void foo(int x) { printf(x); return 0; } void bar() { int z = foo(0); } The result of bar is z because the method foo returned and set the frame pointer to the return address. void foo(int x) { printf(x); return 0; } int foo2(int x) { printf(x); return x; } int foo3(int x) { printf(x); return foo2(0); } foo2 returns and the saved frame pointer is set to the return address 0, then it returns. The method foo3 reads the return address from the stack, prints it and returns it. Then it prints x and returns it. In this situation it is
