Join us on Discord! It might never happen, but there's a chance you could become a moderator for your subreddit. The format is straightforward: You would create an account, then browse the subreddit. After that, you just need to find something to comment on, and post it. After that, the mods can then create a post stating they've granted you moderator privileges. Even if you never get that privilege, you'll be able to give feedback and watch the progression of your subreddit. We also want to extend a special thank you to r/GTA. Reddit gives you the chance to be in control of the content that you're building. After a while, you'll see new suggestions pop up in your feed that you can select. This will also help with discovery - let Reddit help you find some of the best and most interesting content in the world, from gaming and entertainment, to fashion and science. Once you've found the subreddit you want to be a moderator for, you simply have to find an existing post that you can comment on and then just click on the edit button: It's easy to make minor edits - like changing links or adjusting text formatting - but if you're going to change the entire post, you'll be asked to create a new post. Once you're finished, the original post creator has the chance to approve or reject your version, and any disagreements can be resolved by the moderator team. If you get stuck, you can click the little chat bubble at the top of

A simple model to predict the abundance of treated wastewater in rivers and estuaries. There has been a growing interest in the fate and transport of treated wastewater in estuaries and their relation with other contaminants. However, only a few models have been developed to predict the fate and transport of treated wastewater in estuaries, and most of them require complex calculations. In this paper we have developed a simple model to predict the concentration of treated wastewater in rivers and estuaries by quantifying the volume and frequency of flows. The model assumes that the freshwater inflow into the estuary is the result of large-scale temporal changes in soil moisture and runoff from the catchment area. Only precipitation data are required and the volume and frequency of flow are obtained using a relatively simple relationship between runoff and precipitation. The model has been tested in the Mediterranean Sea (Ionian Sea), Italy, for the period 1998-2001. The results show that the model provides estimates of treated wastewater in the river discharge that are comparable to those derived from hydrochemical modelling results.

Moreover, the model has been applied to predict the expected increase in the discharge of treated wastewater in the Wullwif River, as a consequence of the implementation of a WWTP. There's a hidden connection between the 1920s and today. Both the 1920s and the 1990s are periods of innovation. Both were made possible by the interaction of people on the cutting edge of a movement. The 1920s, of course, was the first time collective activities became possible. At the time, people could take part in jazz, movies and dance without being exposed to censure or punishment. On college campuses today, student activists are often on the cutting edge of movements. The civil rights movement of the 1960s and the "Occupy" movement of today inspired many other movements in subsequent decades. Will we know what the next movement is when it starts? I'd like to think so. Subscribe to the Daily Briefing Don't miss a story. Get Berkeleyside headlines delivered to your inbox. Don't miss a story. Get Berkeleyside headlines delivered to your inbox.
