But I'll try to give some context: I want to classify all surjective morphisms from a scheme \$X\$ to \$\mathbb P^n\$. Of course \$\mathbb P^n\$ comes with a natural projection \$\pi \colon \mathbb P^n \to \mathbb P^1\$. So, my question is whether there is an isomorphism \$X \to \mathbb P^1\$ making the diagram commute. In the answer it states that this indeed is the case for a scheme of finite type over a field. But then, let me expand the question a little bit. In algebraic geometry, one defines morphisms by commutative diagrams like this: where \$Z\$ is closed in \$X\$ and \$Y\$ is open in \$Z\$. Of course, we have a morphism of schemes \$f \colon Z \to X\$ and the unique morphism \$g \colon X \to Z\$. So, my question is the following: If I define morphisms in a way to allow isomorphisms instead of unique morphisms, then do we get a morphism of schemes from \$X\$ to \$Z\$ when the diagram commutes? In the special case where \$Z\$ is the spectrum of a field and \$X\$ is the spectrum of a ring, the answer is yes, but I have no idea how to formalise this. A: Yes. The category of schemes has all equalizers. You can read about the axiom of dependent choice in Hartshorne for the development of this fact.
