CAD is an acronym that refers to a broad range of applications that use computers to enable users to design and create documents or drawings. A CAD software application typically includes a variety of tools, including a drawing editor, drafting tools, shape tools, layout tools, and plot tools. CAD applications also can

include other types of tools, such as modeling tools, engineering tools, and validation tools. In the past, CAD applications typically were limited to working with two-dimensional (2D) drawings.

1 Introduction Autodesk AutoCAD is the most widely used CAD

application in the world today. It is used by almost everyone in the industrial, construction, and

consumer markets to design and create two-dimensional (2D) drawings, three-dimensional (3D) models, and schematics of buildings, machinery, and other products. Autodesk AutoCAD software applications are used in a wide range of industries, including architecture, construction, electrical, electronics, manufacturing, mechanical, automotive, aerospace, and other

engineering. AutoCAD's use is broad because it supports the design and creation of models and designs for any type of technology. The Autodesk AutoCAD software applications are sold as a stand-alone desktop application that runs on any computer equipped with a suitable monitor and keyboard. AutoCAD also is available as a web-based application, which makes it

accessible anywhere, even from a mobile device. The 3D computer-aided design (CAD) industry has been growing steadily over the past decade. Computer-aided design (CAD) applications have become more common in the market and the tool is no longer considered an obscure, specialty item. CAD applications are used by architects, builders, draftsmen, electrical

contractors, and many others. The CAD market has grown so rapidly that AutoCAD now is the most widely used application in the world. DXF readers or converters for other programs exist for almost every popular software available today. These tools can then be used for cross-platform handling of the data. External tools can be used to import, export or otherwise manipulate data, such as a shapefile. The application may also be able to determine what data is in the drawing, and

may be able to read in data from a database (DBMS) or other storage device. It is also able to automate repetitive processes and can automatically create views, layouts and other drawings based on imported data. A CAD expert or skilled user may use AutoCAD to create a draft of a building. For example, they may create a large 3D model of the building, with doors

and windows, and may place in a 3D position a chair or other furniture items that are to be displayed in the model. The 3D model will be updated when the designer's changes are applied to the model. When the designer is satisfied, the model may be saved. When the designer decides to make a final version, he or she will convert the model from the

3D drawing format to a 2D drawing format (typically PDF or DWG) and delete the 3D model. The PDF or DWG may then be sent to a print shop for printing. If the print shop processes the drawing, a user may need to open the drawing in a PDF or DWG reader to make further changes. For example, a user may make minor adjustments to the room layouts or add a blueprint to the printing.

An experienced user may be able to make these small changes on his or her own, but many of these changes would not be noticed by the average user, and may even be undetectable to the print shop or other end users. A further possibility is that the designer may work in a collaborative design environment. An example of this is an architectural design team working

together. The team may share the 3D model of the building in a collaborative drawing application.

Changes may be made by each member of the team to the building model. The model may be saved at any time by any team member. A final (2D)

version of the model may then be generated and printed by the print shop.

What's New in the AutoCAD?

Leverage the power of

automation to transfer annotations and comments directly from the page or screen to your drawing, reducing the need for manual correction and re-creation of annotations. (video: 2:50 min.) Take advantage of the new Auto-Hidden elements to hide or temporarily display the annotations and notes that you create directly in your drawing. (video: 2:07 min.)
Lines and Plots: Create

customized lines and plots to quickly analyze your data. With the new fill style feature, you can style your lines to make them stand out from others, or use curves or splines to create non-linear segments of your line. Spline lines have a unique feature that you can use to easily add custom points or notes to your spline: the Cap Spline tool. Cap Splines allow you to add control points to a

spline, making it easy to draw smooth curves and decorative curves. Want to know more? Read our blog post on Lines and Plots for more details on the new features and see how you can create custom lines and plots in AutoCAD.

Drafting Features: Drafting allows you to create more complex, multi-model drawings, which can contain multiple drawings and drawings with multiple

layers. Model space allows you to define a model space in which you can place and manipulate views in relation to each other. Use the new Rename tool to specify new names for your layers, drawings, and references, and rename them to something more meaningful. Use the new “Add Reference” command to easily select a parent drawing for new layers,

drawings, and documents that you create. Use the new “Select Objects” command to rapidly select multiple drawings in a drawing set for quick reuse. Quickly snap to a view or a specific layer with the new “Snap to Layer” command. Use the new “Remove All Users” command to easily remove all users from a model set. Make connections between two drawings without

leaving the current drawing, with the new Cross-Reference tool. Use the new “Create Linked Drawing” command to add a drawing with the same name, or a drawing with the same name and parent, to another drawing. Use the new “Add Constraint” tool to create relationships between drawings. Drawing
