This study explored the socio-demographic correlates of purchasing decisions in a low-income community in Ireland in order to understand what contributes to the food purchasing choices made by the community. To this end, we conducted a cross-sectional survey of food buying behaviour in a convenience sample of low-income households in Kildare. Analysis of data generated by this study suggests that age, gender, occupation and education are important correlates of purchasing decisions. While there were a number of univariate relationships between all six socio-demographic variables and the six food purchasing types (excluding income), multivariate analysis showed that age, gender, education, occupation, and the household size were all significantly associated with purchasing decisions. This study is one of the few that is able to determine the factors associated with low-income households' food purchasing decisions. The study has the potential to better understand the purchasing decisions that are made by low-income households, especially when it comes to meeting the food needs of children.Q: Why aren't unit tests constructed around the code they're testing? This may be a silly question. As a developer I'm often disturbed by the level of detail in unit tests (in terms of writing the test, writing the implementation, etc). I'm working on a project where the unit tests are thoroughly thorough, which is great. However, I'm struggling to figure out why the programmers write these tests with such detail. If I was writing a unit test for a particular implementation I would write a test that consisted of a few lines of code. In the code I'd write assertion statements (assert this, assert that). The way I see it, the tests are supposed to identify the correctness or incorrectness of the implementation. So why don't the tests themselves contain the implementation details? A: This may be a silly question. I'm willing to bet it's not a silly question at all. :) As a developer I'm often disturbed by the level of detail in unit tests (in terms of writing the test, writing the implementation, etc). Your source of discontent may be an incorrect assumption that you can improve a
