The in vitro growth of cytomegalovirus (CMV) and Epstein-Barr virus (EBV) was studied in cell-free cultures of the virus with and without 20% O2 added to the culture media at 37 degrees C. The culture medium was RPMI-1640 with 0.1% human serum, and virus suspension was added at multiplicities of infection of 0.1 and 1. CMV showed no difference in plaque formation in unsupplemented or 20% O2-supplemented medium, whereas EBV plaque formation was greatly enhanced at the lower multiplicity of infection when 20% O2 was present in the medium. Extending the incubation periods up to 72 hr did not alter the results. There was no difference in cytotoxicity of uninfected, CMV-infected, or EBV-infected LBR cells when 20% O2 was added to the medium. These results indicate that adding 20% O2 to the culture medium does not enhance CMV growth and that the enhanced plaque formation seen in 20% O2 was not due to an increased CMV growth per se, but to a diminished effect of CMV on its host cells.Serum protein and albumin concentrations in the Meishan pig and the effects of dietary protein intake. Serum protein concentrations in 11 pigs of the Meishan breed aged 7 days, 90 days, and 20 months were lower than c6a93da74d
