Several years ago, I purchased a solid-state drive to replace my laptop hard drive. My new machine was faster, but I could only use Linux and Windows 7 on it. In 2010, Apple released Lion, its first free version of macOS, and now there are so many applications that cannot be used on Lion (I have

written previously about this). A few months ago I began using Ubuntu. One of my first jobs on the machine was to convert all of my Windows and Office files into Macs standards. In the process, I installed a virtual machine that ran Windows 7 32-bit. Every morning, I open my network folder and pull down all of my files. All have downloaded and transferred fine into a

folder on my desktop. Unfortunately, my boss uses Macs and was about to be very upset by the conversion program mess. So after several failed attempts, I switched to a less complicated name, Desktop Viewer, instead of Converter. While this program is fully functional and very easy to use, it does not convert files on the fly. I put the Desktop Viewer folder on my USB

key and kept it in my pocket as I was switching back and forth between Vista and Ubuntu. After using Ubuntu for several weeks, I was ready to switch to Macs full time. I wanted to install Lion, but I did not want to use the Mac OS X Server option in the install disk. The reason for this was that I simply could not install Server on a USB key. I tried several of the free USB key

programs available online, but they didn't work. Finally, I downloaded Lion from the Mac App Store and created a VM to run it. I then noticed that the OS X Server installer didn't work from the Mac App Store. I called Apple and was told that Lion did not work in virtual machines. I bought a new Mac Pro and had two weeks before the machine was delivered. I set it up and connected it

to my network via ethernet. I opened the Lion install disk on my Mac Pro.

Now, please remember that I had converted all of my files from Vista, Windows 7 and Ubuntu. I had to open in each OS the Desktop Viewer folder that I originally copied from my Mac Pro onto a USB key. I opened the folder and it was the exact same files. I kept my USB key with me as I switched back and

forth between Macs and
Ubuntu. I was constantly
switching back and forth
between Vista and
